L17 ANSWER 1 OF 10 HCA COPYRIGHT 2004 ACS on STN

136:313541 Method for coating of metallic surfaces with an aqueous composition, the aqueous composition and use of the coated substrates. Bittner, Klaus; Domes, Heribert; Wietzoreck, Hardy; Jung, Christian (Chemetall GmbH, Germany; Shimakura, Toshiaki). PCT Int. Appl. WO 2002031222 A2 20020418, 41 pp.

DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CR, CU, CZ, DE, DK, DM, DZ, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, TZ, UA, UG, US, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (German). CODEN: PIXXD2. APPLICATION: WO 2001-EP11506 20011005. PRIORITY: DE 2000-10050532 20001011.

AB The invention relates to a method for coating of a metallic surface with a compn. The compn. contains the following in addn. to water: (a) .gtoreq.1 org. film contg. .gtoreq.1 polymer which is water-sol. or is dispersed in water; (b) a quantity of cations and/or hexafluoro complexes of cations selected from a group comprising Ti, Zr, Hf, Si, Al, and B; and (c) .gtoreq.1 inorg. compd. in a particle form with an av. particle diam. of 0.005-0.2 .mu.m, measured with a scanning electron microscope. The clean metallic surface is brought into contact with the aq. compn., and a film contg. particles is formed on the metallic surface. After drying, the dry film has a layer thickness of 0.01-10 .mu.m. The invention also relates to a corresponding aq. compn.

136:224265 Pretreated sheet product for lithographic plates. Bennett, David; Blake, Sallie L.; Bombalski, Robert E.; Guthrie, Joseph D.; Serafin, Daniel L. (Alcoa Inc., USA). PCT Int. Appl. WO 2002019032 A2 20020307, 20 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CO, CR, CU, CZ, CZ, DE, DE, DK, DK, DM, DZ, EC, EE, ES, FI, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NO, NZ, PH, PL, PT, RO, RU, SD, SE, SG, SI, SK, SK, SL, TJ, TM, TR, TT, TZ, UA, UG, US, UZ, VN, YU, ZA, ZW, AM, AZ, BY, KG, KZ, MD, RU; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (English). CODEN: PIXXD2.

APPLICATION: WO 2001-US41931 20010829. PRIORITY: US 2000-PV228982 20000830; US 2001-PV286145 20010424.

AB The present invention relates to a lithog. sheet product having a substrate with a roll textured surface covered by a pretreatment layer. The pretreatment layer enhances adhesion of a printing

compn. to the sheet product and is composed of a polymer selected from the group consisting of polymers of acrylic acid, polymers of methacrylic acid, an organophosphorous polymer and copolymers of an organophosphorous compd. and acrylic acid or methacrylic acid. Dopant particles of alumina, silica, titanium dioxide or a black dye or pigment may be added to the pretreatment layer to reduce the gloss and **reflectance** of the pretreatment layer in a printing process. Etching of the substrate also reduces gloss and **reflectance**.

AB A method for forming a coating on aluminum by contacting the aluminum with water, at least one multifunctional polymeric org. acid, a monomer of an intrinsically conductive polymer and polymg. the ICP monomer and forming aluminum oxide by imposing an elec. potential between the aluminum surface as the anode and a cathode. The intrinsically conductive polymer salt and aluminum oxide coating that is formed resists corrosion and is resistant to de-doping during immersion in hot water.

AB Coatings for hard tissue and surfaces of the oral environment are provided that reduce adhesion of bacteria and proteinaceous substances to these surfaces. Methods of reducing adhesion of these materials to such surfaces, and polymers for incorporation into such coatings are also provided. Example polymers are polydimethyl siloxanes with various acrylic monomers.

L17 ANSWER 9 OF 10 HCA COPYRIGHT 2004 ACS on STN

101:17301 Effect of polyvinyl phosphonates and ethane hydroxy diphosphonate on mineralization of ectopic bone. Rath, N. C.; Dimitrijevich, S.; Anbar, M. (Dep. Biophys. Sci., State Univ. New York, Buffalo, NY, 14214, USA). Chemico-Biological Interactions, 48(3), 339-47 (English) 1984. CODEN: CBINA8. ISSN: 0009-2797.

AB The effects of polymeric polyphoshonate [27754-99-0] and of ethanehydroxydiphosphonate [2809-21-4] on the development of ectopic bone were compared at different stages of bone development. The diphosphonate affected bone development at different stages, as

reflected by alk. phosphatase and aryl sulphatase activities, as well as by the creation of Ca²⁺ by bone and on its readiness to undergo isotopic exchange. The polymeric polyphosphonate (mol. wt. 3500-8000), on the other hand, did not exhibit any of these effects, although it did inhibit the activity of the enzymes in vitro to an extent comparable with that of the diphosphonate. The results corroborate the assumption that the effects of polymeric polyphosphonate on hard tissues are confined to the extracellular space while the effects of diphosphonates on bone development are due to intracellular activity and not to sequestering of extracellular Ca²⁺.

60:10584 Original Reference No. 60:1935e-g **Composition** for producing adherent coatings on metal parts. (Farbwerke Hoechst A.-G.). GB 935955 19630904, 10 pp. (Unavailable). PRIORITY: DE 19591118.

AB Metal parts are treated with a soln. contg. a copolymer of vinylphosphonic acid (I), poly(vinyl phosphonic acid), and (or) a semiester of I. Thus, degreased steel plates are first pickled and are coated after rinsing with a soln. contg. 12.5 g. copolymer of I and methacrylic acid (mole ratio 0.6:1) in 36.5% by vol. iso-PrOH. After drying for 5 min. at 150.degree., a uniform reddish coating is formed. This is then coated in 2 stages with an alkyd primer and an enamel. After baking, the plates thus treated give excellent results in conventional corrosion and adhesion-tests comparable to those obtained with a good passivated phosphate layer.

L18 ANSWER 1 OF 14 HCA COPYRIGHT 2004 ACS on STN
 139:188347 Photosensitive lithographic printing plate material, its
 manufacture, and aqueous coating solution for the manufacture.
 Kuroki, Takaaki; Hirabayashi, Kazuhiko (Konica Co., Japan). Jpn.
 Kokai Tokkyo Koho JP 2003233170 A2 20030822, 26 pp. (Japanese).
 CODEN: JKXXAF. APPLICATION: JP 2002-33872 20020212.

AB The printing plate material has an intermediate layer between a
 substrate and a photopolymerizable layer contg. ethylenically
 addn.-polymerizable compds. and radical generators sensitive to
 actinic energy beam. In manufg. the printing plate, the
 intermediate layer is formed by coating process, where the layer is
 heated at the max. plate surface temp. 105-250.degree.. Preferably,
 the substrate is electrochem. surface-roughened with an acidic
 medium and then treated with an aq. soln. contg. polyvinylphosphonic
 acid before formation of the intermediate layer. Also claimed is an
 aq. coating soln. contg. ethylenically addn.-polymerizable compds.,
 ring-opening polymerizable compds., amino group-contg. compds., or
 alkoxy group-contg. compds. for formation of the intermediate layer.
 The obtained printing plate material has high interlayer adhesion,
 printability, and background soiling resistance.

 130:227783 Biomimetic calcium phosphate implant coatings and methods for making the same. Sarangapani, Shantha; Calvert, Paul D. (Icet, Inc., USA). PCT Int. Appl. WO 9911202 A1 19990311, 44 pp.
 DESIGNATED STATES: W: CA, JP; RW: AT, BE, CH, CY, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE. (English). CODEN: PIXXD2.
 APPLICATION: WO 1998-US18526 19980904. PRIORITY: US 1997-58105 19970905.

AB This invention encompasses porous, nanocryst., biomimetic Ca phosphate coatings of the order of 2-30 .mu.m that can be grown on metal implants. The chem. surface treatments and methods for making the Ca phosphate coatings are disclosed. Post treatment with dil. hydrogels such as poly(hydroxyethyl methacrylate), reinforces the inorg. structure and enhances the mech. strength of the coatings. Methods are also disclosed for adsorbing or covalently attaching growth factor proteins to the hydrogel-coated Ca phosphate coatings. Such hydrogel-reinforced Ca phosphate coatings show equiv. bone tissue growth as the currently used implants and are easily resorbed. This property in combination with the immobilized growth factors is expected to enhance the process of osteointegration of the disclosed coatings.

 19980504. PRIORITY: US 1997-851306 19970505.
 AB The title coatings comprise acids selected from aminocarboxylic
 acids, tricarboxylic acids, amino acids, phosphonic acids, and
 phenolic compds., polymers, and Ag powder. The coatings resist
 bacterial colonization and encrustation and are useful in medical
 devices and urol. applications. The coating typically includes
 acidic chelating components, reactively bound to a hydrophilic
 polyurethane prepolymer along with noble metal combinations or
 antibacterials. The acidic and noble metal combinations can also be
 incorporated as additives during plastic molding of medical devices.
 Continuous antibacterial surfaces are provided by such coatings and
 materials.

 APPLICATION: JP 1985-93373 19850430.

AB Solns., giving coatings with excellent hydrophilicity even when stained with oil, useful for Al fins in heat exchangers, contain

0.5-10% water-sol. polymers (d.p. 30-2000) selected from poly(alkenesulfonic acid), poly(alkenephosphonic acid), maleic acid-styrene copolymer, polyacrylamide, butene-maleic acid copolymer, poly(acrylic acid) (I), and/or their salts and 1-10% SiO₂ [as xM20.ySiO₂ (II; M = Li, Na, K; y/x .gtoreq.2)]. Thus, an Al plate was coated with an aq. soln. contg. 2.5% I (d.p. 300) and 5% SiO₂ [as II (M = Na, y/x = 3)] and dried to form a 0.2-.mu. coating with water contact angle .ltoreq.10.degree. initially and .ltoreq.10.degree. after 10 days under oily atm., vs. 11-30.degree. and .gtoreq.31.degree., resp., using only I.

100:41796 Post treatment of aluminum oxide layers with alkali metal silicate-containing aqueous solutions in the preparation of offset printing plates. Usbeck, Gerhard; Block, Hans (Hoechst A.-G. , Fed. Rep. Ger.). Ger. Offen. DE 3219922 A1 19831201, 35 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1982-3219922 19820527.

AB Anodized Al is treated in an aq. alkali metal silicate soln. contg. an aliph. hydroxy-mono-, di- or tricarboxylic acid, an aliph. dicarboxylic acid (e.g. succinic) or their H₂O-sol. salts by

immersion or electrochem. to render it more suitable as a support for offset printing plates. Thus, Al foil was electrochem. (a.c.) roughened in dil. HNO₃ and then anodized in dil. H₂SO₄. The foil was finally either treated in Na₂SiO₃.5H₂O, or K Na tartrate or a mixt. of both, and a comparison was made with foil not post-treated. Several different baths for post-treatment are given.

L18 ANSWER 10 OF 14 HCA COPYRIGHT 2004 ACS on STN

85:128553 Post-treatment of phosphated metal surfaces. Schott, Martin; Auel, Theodor (Hoechst A.-G., Fed. Rep. Ger.). Ger. Offen. DE 2455624 19760526, 15 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1974-2455624 19741123.

AB Corrosion resistant, chromate-free coatings are produced on phosphatized ferrous alloys by treating with an aq. soln., contg. the Na or NH₄ salt of (1-phenylvinyl)phosphonic acid (I) or poly[(1-phenylvinyl)phosphonic acid] (II). Mixed polymers of (I) with acrylic or methacrylic acids or their esters are also used, provided the amt. of I in the polymer is >30%. The aq. treating soln. contains 0.1-0.5 g/l I or II. The pH is adjusted to 3.8-4.8 by addn. of H₃PO₄, citric acid, or tartaric acid. This treatment also allows subsequent deposition of adherent lacquer coatings. Thus, a cold-rolled steel sheet was phosphatized in a weakly acidic alkali phosphate soln., and a phosphate coating of .apprx.750 mg/m² was generated. After rinsing and drying, the sheet was treated with an aq. soln. contg. 0.6 g polymeric (1-phenylvinyl)phosphonic

acid/l. at pH 4. The treated sheet was dried, then electrophoretically primed with an epoxy ester coating which was baked 30 min at 180.degree.. The coated sheet exhibited no corrosion when subjected to a salt spray test for 120 hr.

L18 ANSWER 11 OF 14 HCA COPYRIGHT 2004 ACS on STN

80:39972 Surface treatment of electromagnetic steel plate. Kitayama, Minoru; Nakamura, Motoharu; Okada, Hiroshi (Nippon Steel Corp.). Jpn. Tokyo Koho JP 48008700 B4 19730316 Showa, 3 pp. (Japanese). CODEN: JAXXAD. APPLICATION: JP 1969-63989 19690813.

AB A 0.5-1.5% soln. of a poly(alkenephosphonic acid) or a copolymer of an unsatd. org. compd. and an alkenephosphonic acid is applied to the steel plates. Compared with electromagnetic steel plates coated with phosphates or chromates, the plates treated as in the invention had greater punching resistance and corrosion resistance. The alkenephosphonic acids include vinylphosphonic acid, propenephosphonic acid, and allylphosphonic acid. The alkenephosphonic acid copolymers include those with crotonic acid, acrylic acid, or maleic anhydride.

139:246997 Use of block copolymers bearing phosphate and/or phosphonate functions as adhesion promoters or as protecting agents against the corrosion of a metallic surface. Destarac, Mathias; Bonnet-Gonnet, Cecile; Cadix, Arnaud (Rhodia Chimie, Fr.). PCT Int. Appl. WO 2003076529 A1 20030918, 43 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, BZ, CA, CH, CN, CO, CR, CU, CZ, DE, DK, DM, DZ, EC, EE, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NI, NO, NZ, OM, PH, PL, PT, RO, RU, SC, SD, SE, SG, SK, SL, TJ, TM, TN, TR, TZ, UA, UG, US, UZ, VC, VN, YU, ZA, ZM, ZW, AM, AZ, BY, KG, KZ, MD, RU, TJ, TM; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (French). CODEN: PIXXD2. APPLICATION: WO 2003-FR788 20030312. PRIORITY: FR 2002-3111 20020313.

AB The invention relates to the use of a block copolymer having at least one block that comprises phosphate and/or phosphonate functions in order to produce a deposit on a metallic surface, such as a steel or aluminum surface, which can be used, for example, to improve the effectiveness of the subsequent application of a film-forming compn. on the thus altered surface or to protect the metallic surface against corrosion. The invention also relates to a method of applying paint or mastic compns. to a metallic surface, which involves the above-mentioned inventive use of said block copolymers, and the coated metallic materials that can be produced using said application method. A typical block copolymer was manufd. by polymn. of acrylamide (50 g 50% aq. soln.) 5 h at 70.degree. in an aq. Me₂CO soln. in the presence of 4,4-azobis(4-cyanovaleric acid) (I) and O-ethyl-S-[(1-methoxycarbonyl)ethyl] xanthate and polymn. of 1.32 g vinylphosphonic acid and 7.14 g acrylic acid at 70.degree. in the resulting soln., with the addn. of more I.

 (German). CODEN: PIXXD2. APPLICATION: WO 2001-EP11738 20011010.

PRIORITY: DE 2000-10050532 20001011; DE 2001-10110830 20010306; DE 2001-10119606 20010421.

AB The invention relates to a method for coating a metallic strip. The strip or optionally, the strip sections produced from said strip in the subsequent process, is/are coated first with at least one anticorrosion layer and then with at least one layer of a paint-like coating contg. polymers and/or with at least one paint coating. After being coated with at least one anticorrosion layer or after being coated with at least one layer of a paint-like coating and/or with at least one paint coating, the strip is divided into strip sections. The coated strip sections are then formed, joined and/or coated with at least one (other) paint-like coating and/or paint coating. At least one of the anticorrosion layers is formed by coating the surface with an aq. dispersion contg. the following in addn. to water: (a) at least one org. film former contg. at least one water-sol. or water-dispersed polymer; (b) a quantity of cations and/or hexa- or tetrafluoro complexes of cations chosen from a group consisting of titanium, zirconium, hafnium, silicon, aluminum and boron; and (c) at least one inorg. compd. in particle form with an av. particle diam. measured on a scanning electron microscope of 0.005 to 0.2 .mu.m. The clean metallic surface is brought into contact with the aq. compn. and a film contg. particles is formed on the metallic surface, this film then being dried and optionally also hardened, the dried and optionally, also hardened film having a layer thickness of 0.01 to 10 .mu.m. The speed of coating metal objects with complex profiles is high using this process and need of Cr⁶⁺ compds. and acids is reduced. The coated products are useful in manuf. of automobile bodies, aircraft, and spacecraft.

AB An aluminum alloy substrate is pretreated with an aq. soln. contg. an organophosphorus compd., preferably a vinylphosphonic acid-acrylic acid copolymer, before coating the substrate with a polymer. Passing the substrate through the soln. contaminates it with aluminum and other elements. The pretreatment soln. is rejuvenated by removing aluminum with a cation exchange resin that preferably contains a styrene-divinyl benzene copolymer functionalized with sulfonate groups. Rinsing the substrate contaminates the rinse water with the copolymer. The rinse water is concd. by reverse osmosis or membrane ultrafiltration and returned to the pretreatment soln.

89:112580 Improving the adhesion of coatings on metal substrates.

Georgios, Pampouchidis (Vianova Kunstharz A.-G., Austria). Austrian AT 342737 19780425, 5 pp. (German). CODEN: AUXXAK. APPLICATION: AT 1975-8115 19751024.

AB Phosphoric acid or phosphonic acid compds. contg. .gtoreq.1 free OH group and .gtoreq.1 polymerizable double bond are used as adhesion promoters in lacquers and paints to improve their adhesion to Fe, Cu, Zn, Sn, or Al substrates. Thus, 360 g bisphenol A-epichlorohydrin copolymer with epoxide equiv. 172-8 was treated with 564 g tetrahydrophthalic anhydride monohydroxyethyl acrylate ester in the presence of 0.4 g hydroquinone and 0.5 g Et₃N at 95-100.degree. until the acid no. of the product was 1-2 mg KOH/g. The solids content of the compn. was adjusted to 80% with a 1:1 Bu acrylate-1,4-butanediol dimethacrylate mixt. and 250 g soln. was mixed with 62.5 g reaction product of 130 g hydroxyethyl methacrylate and 222 g isophorone diisocyanate and 1 g vinylphosphonic acid (I). Coatings prep'd. from the compn. displayed better adhesion to Al, steel, Cu, and galvanized tinplate than coatings prep'd. from similar compns. without I.

L19 ANSWER 18 OF 22 HCA COPYRIGHT 2004 ACS on STN

62:89215 Original Reference No. 62:15865b-d Adherent coatings on metal parts. Herbst, Willy; Rochlitz, Fritz; Vilcsek, Herbert; Wagner, Ernst (Metallgesellschaft A.-G.). DE 1188411 19650304, 3 pp.; Addn. to Ger. 1,184,588 (CA 62, 6213c) (Unavailable). APPLICATION: DE 19600408.

AB Instead of the soln. of the polymer of poly(vinylphosphonic acid) (I) in H₂O of the principal patent (as an adhesive layer for protection against corrosion), the metal is coated with a 0.01-7% aq. soln. of a mixed polymer of I and one or more unsatd. org. compds. with polar characteristics, such as acrylic and methacrylic acids, their esters, amides and nitriles, vinyl esters, maleic acid anhydride, and crotonic acid. The aq. soln. preferably contains a C1-4 alc. The mixed polymers are economical, and since they are less sticky they are easier to manipulate than homopolymers of I. The coated products have good adhesion for lacquers. Thus, degreased steel is etched with HCl, rinsed, and wiped with a soln. of H₂O 635, iso-PrOH 365 ml., and 12.5 g. of a mixed polymer of I and methacrylic acid in the mole proportions of 0.6:1. The coated sheet is dried 10 min. at 115.degree.. Ground and surface layers of com. lacquers may then be applied to the coated product.

- L19 ANSWER 19 OF 22 HCA COPYRIGHT 2004 ACS on STN
 62:35394 Original Reference No. 62:6213e-g, 6214a Protecting metals from
 corrosion. Duch, Eduard; Herbst, Willy; Rochlitz, Fritz; Scherer,
 Hans; Vilcsek, Herbert (Metallgesellschaft A.-G.). DE 1182926
 19641203, 4 pp. (Unavailable) APPLICATION: DE 19600831.
- AB The metal is treated with a 0.1-15% soln. (in H₂O and (or) iso-PrOH)
 of a mixt. of an alkenyl-phosphonic acid, esp. vinylphosphonic acid
 (I), and .gtoreq.1 of the following: poly(vinylphosphonic acid)
 (II), a polymer of a half-ester of I, a copolymer of I (or its
 half-ester) with an unsatd. org. compd., such as acrylic acid, an
 acrylic ester, a vinyl ester, or maleic anhydride, or a P-free
 polymer which contains acid groups, esp. poly(acrylic acid) or a
 vinyl alkyl ether-maleic anhydride copolymer. Thus, degreased
 auto-body sheet steel was rinsed with cold water, dipped 10 sec. in
 a warm (44.degree.) soln. of 27 g. I and 3 g. of a copolymer of I
 and acrylic acid (mole ratio 1:1) in 970 g. H₂O, and dried at
 130.degree. for 4 min. When given 2 coats of an alkyd baking enamel
 (baked 25 min. at 145.degree.), the system had outstanding coating
 adhesion and corrosion resistance. In another example, pickled,
 scaled steel was dipped for 20 sec. in a soln. of I 42, II 18,
 iso-PrOH 610, and H₂O 330 g. and baked 5 min. at 130.degree.. The
 sheet showed no signs of rusting after 4 weeks exposure to the fumes
 from boiling HCl. Untreated pickled sheet rusted in 1 hr.

AB The coating inhibited corrosion or served as a primer for other
 coatings. Steel automobile body parts were degreased, rinsed with
 water, dipped in a mixt. of 565 ml. water, 435 ml. iso-PrOH, and 60
 g. 35% poly(vinylphosphonic acid) in iso-PrOH, dried 5 min. at
 150.degree., and then painted with lacquer. The painted parts had
 good corrosion resistance.

L19 ANSWER 21 OF 22 HCA COPYRIGHT 2004 ACS on STN

61:19163 Original Reference No. 61:3308g-h,3309a Organic coatings for metallic surfaces. (Farbwerke Hoechst A.-G.). GB 954566 19640408, 5 pp.; Addn. to Brit. 935,955 (CA 60, 1935f) (Unavailable).

PRIORITY: DE 19600831.

AB The adherent, corrosion-resistant H₂O or alc. solns. of poly(vinylphosphonic acid) (I), which were previously disclosed as providing good bases for lacquers and varnishes on metallic surfaces, are improved by the addn. of a monomeric alkenylphosphonic acid, e.g. vinylphosphonic acid (II), or its copolymers with other acids, with optionally P-free polymers contg. acid groups, or certain homopolymers of an acid deriv. of II, or combinations thereof. The solns. for most purposes should contain about 1-8% monomeric alkenylphosphonic acid and polymer, the latter being in minor proportion. Suitable solvents are aliphatic Cl-4 alcs., preferably iso-PrOH or its mixts. with H₂O, and a wetting agent is desirable with the H₂O. Suitable P-free polymers for these solns. are poly(acrylic acid), a copolymer of vinyl alkyl ether and maleic anhydride, and their esters, amides, and nitriles. Polymerization need not be complete. Numerous mixts. of II with various polymers are listed as giving good adherence and corrosion resistance when coated with lacquers or varnish. When pickled and rinsed steel plates were immersed for 20 sec. in a soln. contg. iso-PrOH 610, H₂O 330, phosphonic acid 42, and I 18 g., dried 5 min. at 130.degree., and hung under a hood where HCl was boiled every day and where untreated steel rusted in 1 hr., they remained free from rust for 4 weeks.
